

ABSTRACT OF DISCLOSURE

A virtual store server is provided in a virtual store of at least one of tie-up companies. The virtual store is established on the internet so as to issue points to a member upon access to the virtual store. The virtual store server includes a virtual store point DB for recording the number of the issued points. When the member makes a purchase in the actual store with the number of points that has been read by at least one terminal provided in an actual store, the terminal functions in reducing the number of points that has been read and used in the actual store.
